## 7.5 Gomory Hu

```
* returns edges of the Gomory-Hu tree. The max flow between any pair
     * vertices is given by minimum edge weight along the Gomory-Hu tree
     * Time: $0(V)$ Flow Computations
     * Status: Tested on CERC 2015 J, stress-tested
11
\tilde{1}\tilde{2}
     * Details: The implementation used here is not actually the original
13
     * Gomory-Hu, but Gusfield's simplified version: "Very simple methods
     * pairs network flow analysis". PushRelabel is used here, but any
15
     * implementation that supports 'leftOfMinCut' also works.

## 7.6 HopcraftKarp BPM

```
* Author: Chen Xing
     * Date: 2009-10-13
    * License: CC0
    * Source: N/A
    \star Description: Fast bipartite matching algorithm. Graph $9$ should be
     * of neighbors of the left partition, and $btoa$ should be a vector
     \star -1's of the same size as the right partition. Returns the size of
9
     * the matching. $btoa[i]$ will be the match for vertex $i$ on the
         right side,
     * or $-1$ if it's not matched.
11
     * Usage: vi btoa(m, -1); hopcroftKarp(g, btoa);
12
     * Time: O(\sqrt{V}E)
13
     * Status: stress-tested by MinimumVertexCover, and tested on
         oldkattis.adkbipmatch and SPOJ:MATCHING
15

## 9.4 Suffix Array Kactl

```
struct SuffixArray {
        using vi = vector<int>;
        #define rep(i,a,b) for(int i = a; i < b; i++)
        \#define all(x) begin(x), end(x)
             Note this code is considers also the empty suffix
             so hear sa[0] = n and sa[1] is the smallest non empty suffix
             and sa[n] is the largest non empty suffix
 8
             also LCP[i] = LCP(sa[i-1], sa[i]), meanining LCP[0] = LCP[1] =
10
             if you want to get LCP(i..j) you need to build a mapping
                 het ween
11
             sa[i] and i, and build a min sparse table to calculate the
                 minimum
             note that this minimum should consider sa[i+1...j] since you
                 don't want
             to consider LCP(sa[i], sa[i-1])
14
\overline{15}
             you should also print the suffix array and lcp at the
                 beginning of the contest
16
             to clarify this stuff
17
18
        vi sa, lcp;
19
        SuffixArray(string& s, int lim=256) { // or basic_string<int>

                   v[v[i].link].co += v[i].co;
```

#### 9.6 Zalgo Anany

# 9.7 lexicographically smallest rotation of a string

```
1  int minRotation(string s) {
2     int a=0, N=sz(s); s += s;
3     rep(b,0,N) rep(k,0,N) {
4        if (a+k == b || s[a+k] < s[b+k]) {b += max(0, k-1); break;}
5        if (s[a+k] > s[b+k]) { a = b; break; }
6     }
7     return a;
```

#### 10 Trees

#### 10.1 Centroid Decomposition

```
Properties:
            1. consider path(a,b) can be decomposed to path(a,lca(a,b))
                and path (b, lca(a,b))
            where lca(a,b) is the lca on the centroid tree
            2. Each one of the n^2 paths is the concatenation of two paths
                 in a set of O(n lg(n))
            paths from a node to all its ancestors in the centroid
                decomposition.
            3. Ancestor of a node in the original tree is either an
                ancestor in the CD tree or
            a descendadnt
   vector<int> adj[N]; //adjacency list of original graph
11
   int n;
   int sz[N];
13
   bool used[N];
   int centPar[N]; //parent in centroid
15
   void init(int node, int par) { ///initialize size
        sz[node] = 1;
17
        for(auto p : adj[node])
18
            if(p != par && !used[p]) {
                init(p, node);
20
                sz[node] += sz[p];
21
   int centroid (int node, int par, int limit) { ///get centroid
24
        for(int p : adj[node])
25
            if(!used[p] && p != par && sz[p] * 2 > limit)
            return centroid(p, node, limit);
        return node;
   int decompose(int node) {
        init(node, node); ///calculate size
        int c = centroid(node, node, sz[node]); ///get centroid

```

# 12 Guide

#### 12.1 Notes

- Don't forget to solve the problem in reverse (i.e deleting-¿adding or adding-¿deleting, ...etc)
- Max flow is just choosing the maximum number of paths between source and sink
- If you have a problem that tells you choose a[i] or b[i] (or a range) choose one of them initially and play a take or leave on the other
- $\bullet$  If the problem tells you to do something cyclic solving it for x + x
- Problems that are close to NP problems sometimes have greedy solutions for large input i.e n ;=20-30
- in case of merging between sets try bitsets (i.e i + j or sth)

- If you have a TLE soln using bitset might help
- If everything else fails think Brute force or randomization

# 12.2 Assignment Problems

- If you see a problem that tells you out of N choose K that has some property (think flows or aliens trick)
- If you see a problem that tells for some X choose a Y (think flows)
- If the problem tells you to choose a Y from L-¿R (think range flow i.e putting edges between the same layer)

# 12.3 XOR problems

- If the problem tells your something about choosing an XOR of a subset (think FWHT or XOR-basis)
- If the problem tells you about getting XOR of a tree path let a[i] = XOR 12.7 tree from root to i and solve this as an array
- If the problem tells you range XOR sth it's better to have prefix XOR and make it pairs XOR.

## 12.4 Decompositions

- If a problem is a asking you to calculate the answer after K steps you can calculate the answer for K
- If the nubmer of queries is significantly larger than updates or vice versa you can use square root Decompositions to give advantage to one over the other

# 12.5 Strings

- Longest Common Substring is easier with suffix automaton
- Problems that tell you cound stuff that appears X times or count appearnces (Use suffixr links)
- Problems that tell you find the largest substring with some property (Use Suffix links)
- Remember suffix links are the same as aho corasic failure links (you can memoize them with dp)

- Problems that ask you to get the k-th string (can be either suffix automaton or array)
- Longest Common Prefix is mostly a (suffix automaton-array) thing
- try thinking bitsets

#### **12.6** Trees

- For problems that ask you to count stuff in a substree think (Euler Tour with RQ Small to Large DSU on Trees PersistentSegTree)
- Note that the farthest node to any node in the tree is one of the two diameter heads
- In case of asking F(node, x) for each node it's probably DP on Trees

#### 12.7 Flows

- If you want to make a K-covering instead of consdiring lit edges consider non-lit edges
- To get mincost while mainting a flow network (note that flows are batched together according to cost)
- If the problem asks you to choose some stuff the minimizes use Min Cut (If maximizes sum up stuff and subtract min cut)

## 12.8 Geometry

- Manhattan to King distance (x,y) - $\xi$  (x+y, x-y)
- Lattice points on line: gcd(dx,dy) + 1
- Pick's theorem:  $A = I + \frac{B}{2} 1$
- cosine rule:  $C^2 = A^2 + B^2 2AB \times cos(c)$
- Rotation around axis:  $R = (cos(a) \times Id + sin(a) \times crossU + (1 cos(a)) \times outerU)$
- Triangulation of n-gon = Catalan (n-2)

- triangle =  $\sqrt{(S \times (S A) \times (S B) \times (S C))}$ , S = PERIMETER/2
- triangle =  $r \times S$ , r = radius of inscribed circle
- ellipse =  $\pi \times r_1 \times r_2$
- sector =  $\frac{(r^2 \times a)}{2}$
- circular cap =  $\frac{R^2 \times (a \sin(a))}{2}$
- prsim = perimeter(B)L + 2area(B)
- sphere =  $4\pi r^2$

#### 12.10 Volume

- Right circular cylinder =  $\pi r^2 h$
- Pyramid =  $\frac{Bh}{3}$
- Right circular cone =  $\frac{\pi r^2 h}{3}$
- Sphere =  $\frac{4}{3}\pi r^2 h$
- Sphere sector=  $\frac{2}{3}\pi r^2 h = \frac{2}{3}\pi r^3 (1 \cos(a))$
- Sphere cap =  $\frac{\pi h^2(3r-h)}{3}$

#### 12.11 Combinatorics

- Cayley formula: number of forest with k trees where first k nodes belongs to different trees =  $kn^{n-k-1}$ . Multinomial theorem for trees of given degree sequence  $\binom{n}{d_i}$
- Prufer sequence (M5da calls it parent array)
- K-Cyclic permutation =  $\binom{n}{k} \times (k-1)!$
- Stirling numbers  $S(n,k) = k \times S(n-1,k) + S(n,k-1)$  number of way to partition n in k sets.
- Bell number  $B_n = \sum_{1}^{n} (n-1, k) B_k$

- # ways to make a graph with k components connected  $n^{k-2} \times \prod_{i=1}^k s_i$
- Arithmetic-geometric-progression  $S_n = \frac{A_1 \times G_1 A_{n+1} \times G_{n+1}}{1-r} + \frac{dr}{(1-r)^2} \times (G_1 G_{n+1})$

# 12.12 Graph Theory

- Graph realization problem: sorted decreasing degrees:  $\sum_{1}^{k} d_i = k(k-1) + sum_(k+1)^n \min(d_i, k)$  (first k form clique and all other nodes are connected to them).
- Euler formula: v + f = e + c + 1
- # perfect matching in bipartite graph, DP[S][j] = DP[S][j-1] + DP[S/v][j-1] for all v connected to the j node.

#### 12.13 Max flow with lower bound

- feasible flow in a network with both upper and lower capacity constraints, no source or sink: capacities are changed to upper bound lower bound. Add a new source and a sink. let M[v] = (sum of lower bounds of ingoing edges to v) (sum of lower bounds of outgoing edges from v). For all v, if  $M[v]_{\clineth{\o}}0$  then add edge (S,v) with capacity M, otherwise add (v,T) with capacity -M. If all outgoing edges from S are full, then a feasible flow exists, it is the flow plus the original lower bounds.
- maximum flow in a network with both upper and lower capacity constraints, with source s and sink t: add edge (t,s) with capacity infinity. Binary search for the lower bound, check whether a feasible exists for a network WITH-OUT source or sink (B).

## 12.14 Joseph problem

$$g(n,k) = \begin{cases} 0 & \text{if } n = 1\\ (g(n-1,k)+k) \bmod n & \text{if } 1 < n < k\\ \left\lfloor \frac{k((g(n',k)-n \bmod k) \bmod n')}{k-1} \right\rfloor \text{ where } n' = n - \left\lfloor \frac{n}{k} \right\rfloor & \text{if } k \le n \end{cases}$$
